

Introduction of more customers' choices

Component A: Automatic Refilling-Station Unit

Component A is applicable for 200L raw materials packed in metal barrel, which can avoid the impairment on the glue tape quality caused by the stratification of component A. The operation of component A feeding is simple, as it only needs to set the stirring parameters in the computer and then the machine will operate automatically; meanwhile, with the function of automatically monitoring feeding, the machine can automatically feed materials according to signals given by the sensor of the material barrel to avoid pollution to the whole barrel of raw materials caused by manual operation.

Component B: Automatic Refilling-Station Unit

Component B is applicable for the raw material packed in 200L barrel. The operation of component B feeding is simple, as it only needs to set automatic feeding function in the Computer, and the machine can automatically feed materials according to signals given by the sensor of the material barrel to avoid pollution to the whole barrel of raw materials caused by manual operation.

Automatic Single- / Double-Level Shuttle Table

Automatic shuttle table are divided into two types: single-level alternatively; double-level alternatively. Platforms with different dimensions can be customized.

With the automatic shuttle table, the machine can fast and conveniently switch different types of workpiece, reduce the waiting time arising from the workpiece replacement and therefore greatly reduce the waste and cleaning frequency of raw materials; because of the separation of operator and machines, the operation is safer.

Thermostatic Water Cycle

With the automatic shuttle table, the machine can fast and conveniently switch different types of workpieces, reduce... because of the separation of operator and machine, the operation is safer.
